Definition:

Control structures are statements used to control the flow of execution in a program. They help in decision-making and repeating tasks

Syntax:

```
If(condition)

{

    // statements

}
```

If Statement:

An if statement is used to execute a block of code only when the given condition is true.

Example:

```
public class Main {

    public static void main(String[] args) {

        int number = 10;

        if(number > 0) {

            System.out.println("Positive Number");

        }

    }

}
```

else-if Statement

- An else if statement is used to check multiple conditions one by one.
- If the first condition is false, the next condition is checked.

Example:

```
public class Main {  
  
    public static void main(String[] args) {  
  
        int mark = 75;  
  
        if(mark >= 90) {  
  
            System.out.println("Grade A");  
  
        }  
  
        else if(mark >= 60) {  
  
            System.out.println("Grade B");  
  
        }  
  
        else {  
  
            System.out.println("Fail");  
  
        }  
  
    }  
  
}
```

switch Case

A switch case statement is used to select one block of code from multiple choices.

Example:

```
public class Main {  
  
    public static void main(String[] args) {  
  
        int day = 2;  
  
        switch(day) {  
  
            case 1:  
  
                System.out.println("Monday")  
  
                break;  
  
            case 2:  
  
                System.out.println("Tuesday");  
  
                break;  
  
            case 3:  
  
                System.out.println("Wednesday");  
  
                break;  
  
            default:  
  
                System.out.println("Invalid Day");  
  
        }  
  
    }  
  
}
```
